

# HOW TO MAP TO NETWORK SHARE DRIVE for Windows

**NOTE: SAS can ONLY install on Win 7, 8.1 Pro or Ultimate version.**

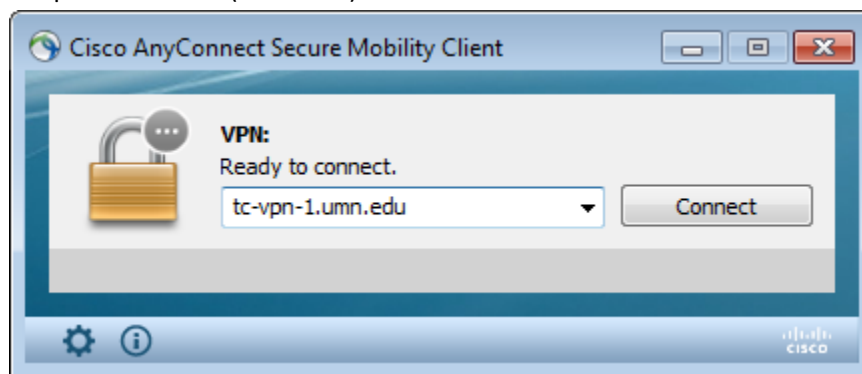

There are 3 factors you would need to access department share drive

- VPN Client – Creating secure tunnel to connect to University resources
- The path - where the resource located
- User : A valid user name and password

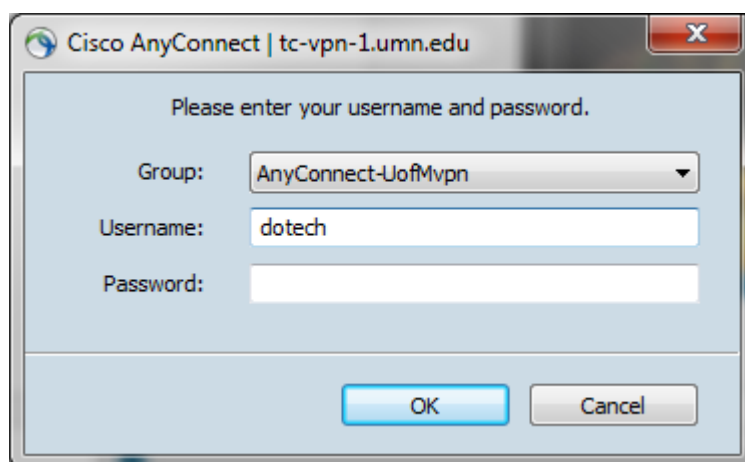

## How to get VPN?

To download VPN, you can go to: <http://it.umn.edu/downloads-guides>. Make you select appropriate platform version for your operating system. After you downloaded the VPN, follow the installation instruction below:

- In Program Files→Cisco→Cisco AnyConnection Secure Client. Make sure you type: tc-vpn-1.umn.edu (as shown)→ Connect.

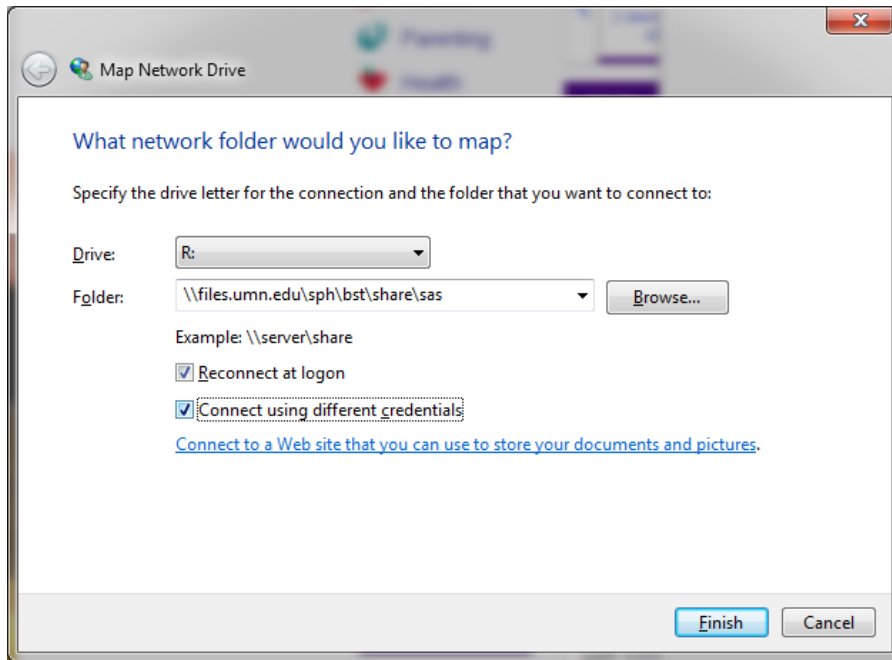

In Group, select option as shown below. Type your x500 user name and password.

After Cisco connected, you are ready to map to your network share drive.

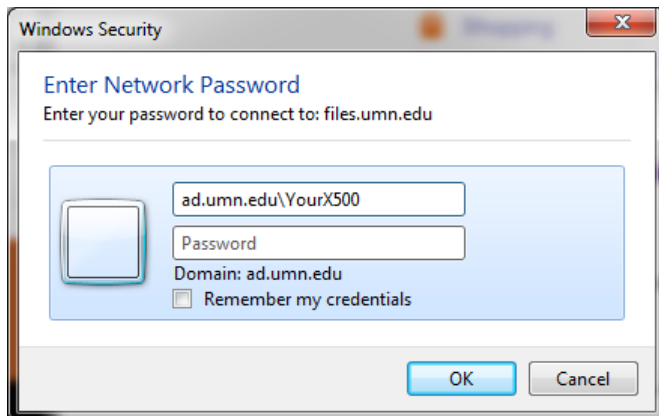

Start→Computer (Right Click)→Map Network Drive (shown below)

In Drive, you can just use default letter.

In Folder, type the path as showing.

Connect Using Different Credentials show be check marked as showing→ Finish.

Type in your University X500 as shown above and password→ok.

Congratulation. You are now connecting to SAS 9.4. Just open either folder and look for setup.exe to install. I strongly recommend you copy down to your local drive (C: drive) before install. If you choose to install it directly, allow yourself at least about an hour.
